

1. Not sure how these accessibility categories of excellent, good , moderate etc are being calculated.

2. Variety is being shown as categories of Low medium and High.

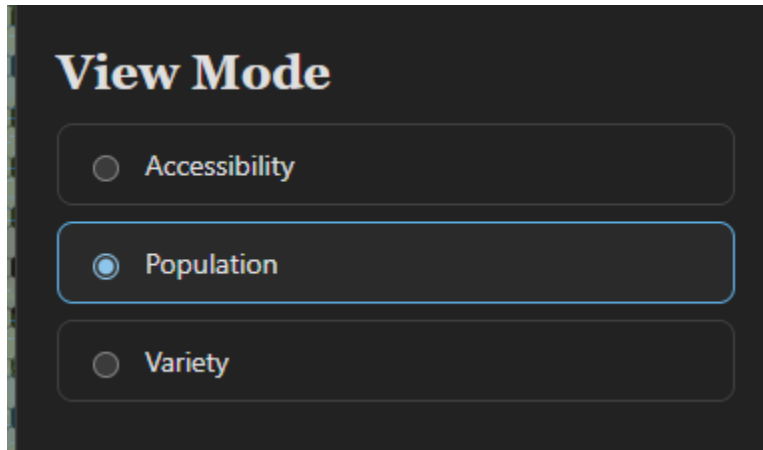

3. Population is being shown as Low, Medium, high

What we want:

1. The data contained in the files to be categorized in various categories in the following way:

The image shows a 'View Mode' selector interface. It has a dark background with the title 'View Mode' in a stylized font. Below the title are three radio button options: 'Accessibility', 'Population', and 'Variety'. The 'Population' option is selected, indicated by a blue dot and a blue border around its container.

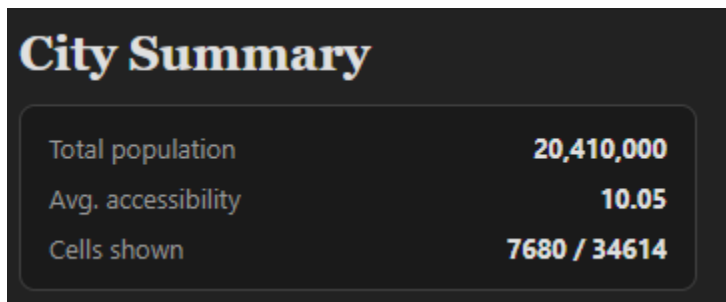

View Mode

☐ Accessibility

☒ Population

☐ Variety

- a) This is fine, we want the selector to be like this i.e. if we select population, the visualization of population is shown and if we select total_destinations, then that feature is shown..... means the page should show the feature we select

The image shows a 'City Summary' table. It has a dark background with the title 'City Summary' in a stylized font. The table contains three rows of data: 'Total population' with value '20,410,000', 'Avg. accessibility' with value '10.05', and 'Cells shown' with value '7680 / 34614'.

City Summary

Total population	20,410,000
Avg. accessibility	10.05
Cells shown	7680 / 34614

- b) This also looks good. Total population and avg accessibility is shown but..avg_variety for the city is not shown. It should also be here.

Selected Cell

H3 index	8a608b56c8d7fff
Population	2,166
Destinations score	7.7
Variety	4
Accessibility	Excellent

- c) This also looks good. But accessibility category of excellent, good etc is not present in the data. SO either include the description here how is it being calculated as excellent, good, moderate and poor OR...show the following when selected for destination score, variety and population:

---> These symbology properties for population:

Plot looks like this:

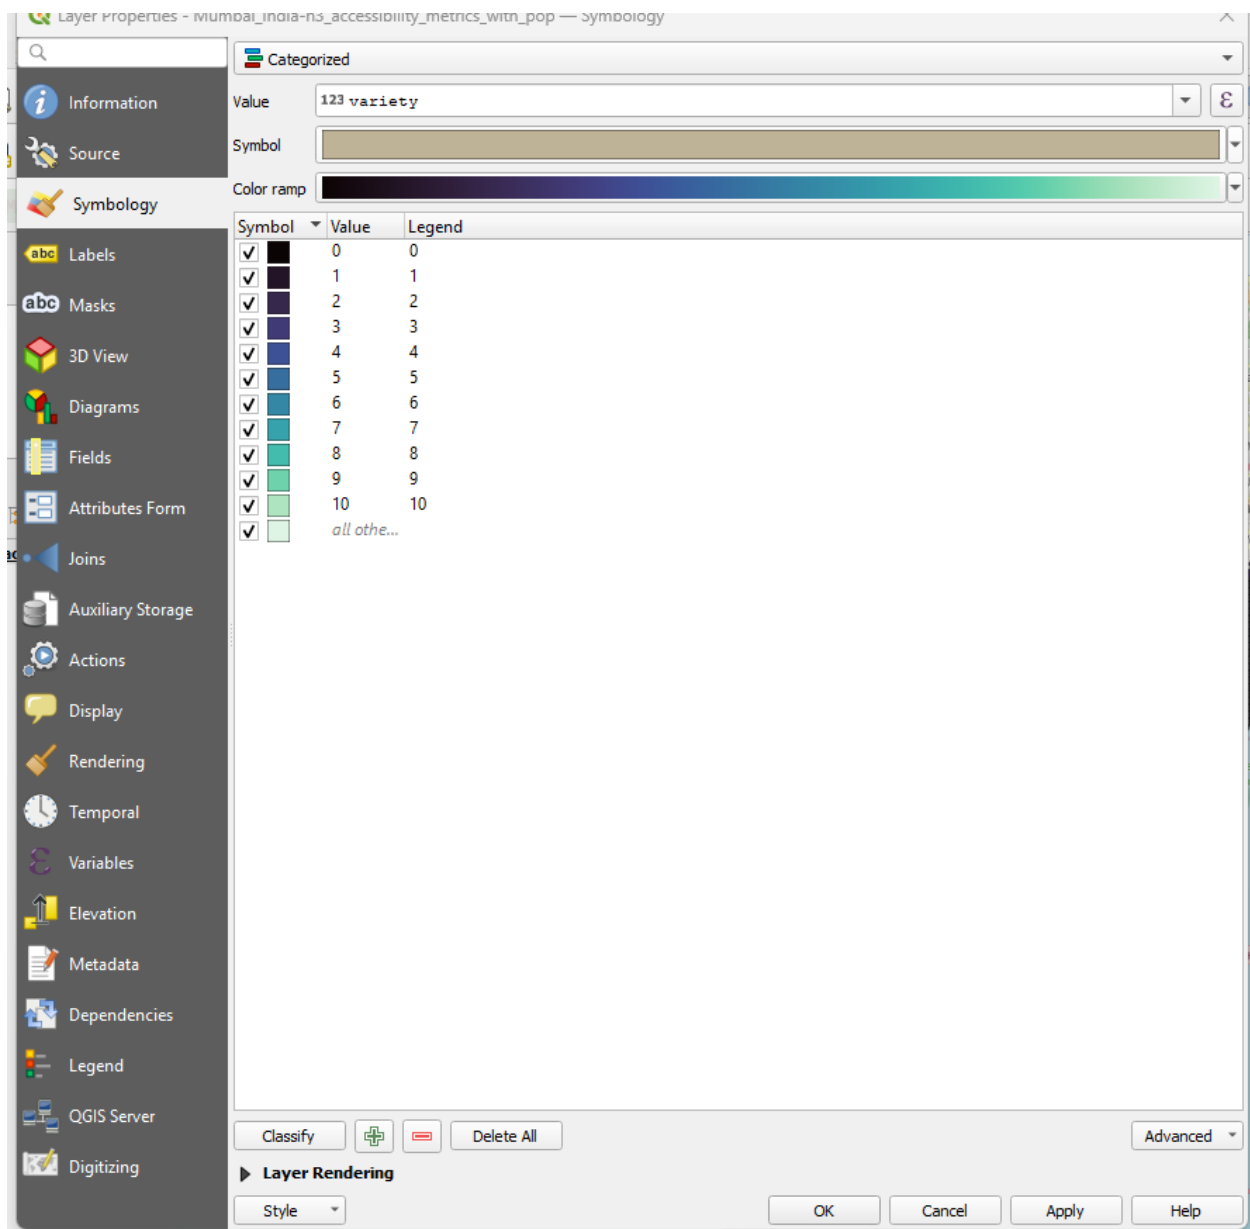

----> For total destinations we want following symbology:

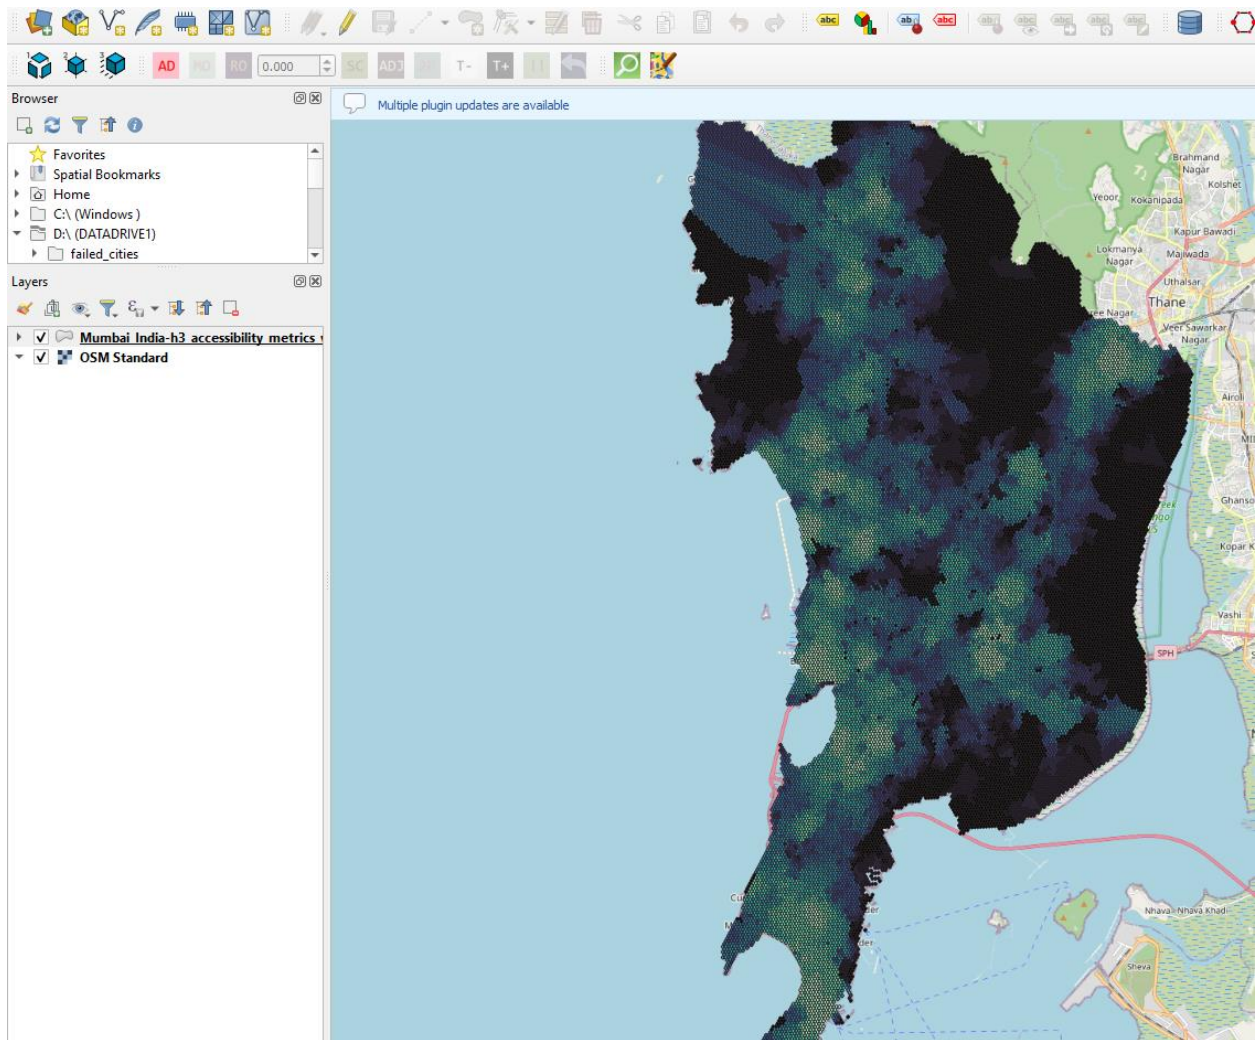

Plots should look like this with mode Natural breaks:

---> For variety, use following symbology properties:

Plot should look like this:

So plots should essentially look this for each city. Same symbology properties should be used for each variable of the cities.
